

In the claims:

Claims 1-40 cancelled.

41. (currently amended) A system for manufacturing a personal golf putter, comprising a putting surface with at least one hole into which a golfer ~~putts~~puts balls; an initial putter with which the golfer hits the balls so as to put the balls into the hole and having a serial number; interior sensing means for sensing parameters of the initial putter including the serial number during hitting the balls by the golfer to putt the balls into the hole and incorporated in said initial putter; interior swing data collecting and processing means for collecting and processing swing data corresponding to said sensed parameters and incorporated in said initial putter; interior transmitting means for transmitting said data corresponding to the sensed parameters and incorporated in said initial putter and also transmitting the serial number with each swing data; computing means for receiving and processing said swing data; and design and manufacturing means for receiving the swing data from said computing means, determining final parameters of a personal putter based on said swing data, and making the personal putter with said final parameters obtained

with use of said interior sensing means, said interior collecting means, and said interior transmitting means incorporated in said initial putter.

42. (previously presented) A system as defined in claim 41, wherein said computing means is formed as a computer which is remote from said putting surface, and said initial putter

43. (previously presented) A system as defined in claim 41, wherein said data collecting and processing means include a microprocessor connected with electrical signals amplifying means and collecting data from said sensing means to configure said data.

44. (previously presented) A system as defined in claim 41, wherein said computing means is selected from the group consisting of a remote receiving computer, a pocket personal computer with compatible signal receiving means, and a laptop computer with wireless receiving means.

45. (previously presented) A system as defined in claim 41; and further comprising a display unit selected from the group consisting of

a display unit connected to said computing means and a display unit formed as an integral part of said computing means.

46. (previously presented) A system as defined in claim 45, wherein said display unit is formed so as to display any information selected from the group consisting of a position of a putter handle, position of putter head, lie and loft angles with text identifying a deviation in degrees, a putter path during a swing, an acceleration and a deceleration of a putter head alongside of a putter path, a text message with details related to a swing in real time, in combinations thereof.

47. (previously presented) A system as defined in claim 45, wherein said display is provided with radio buttons for computer commands selected from the group consisting of save, recall, and replay.

48. (previously presented) A system as defined in claim 41, wherein said computing means is connected to an internet network.

49. (previously presented) A system as defined in claim 41, wherein said transmitting means is formed so as to transmit information selected from the group consisting of lie and loft angles, a weight of putter

head, a weight of a putter shaft, a location of a center of gravity of a putter head, a putter face angle, a shaft lie angle, and offset position, an identification of a golfer who hits the ball with a golf putter, the serial number, and combinations thereof.

50. (previously presented) A system as defined in claim 49, wherein said initial putter has a handle and a head, said sensing means including acceleration/deceleration measuring means, one part of putter path measuring means, and rotation measuring means located in said head, and also including lie/loft angles measuring means and another part of the putter path measuring means located in said handle.

51. (previously presented) A system as defined in claim 50, wherein said data collecting and processing means and said transmitting means are located in said handle.

52. (previously presented) A system as defined in claim 41; and further comprising a training putter which is identical with said final personal putter, and in addition has the serial number, said sensing means, said data collecting and processing means, and said transmitting means.

53. (previously presented) A system as defined in claim 41; and further comprising a switch actuatable by a user and switching operation of electronic system of said initial putter between a plurality of modes.

54. (previously presented) A system as defined in claim 53; and further comprising indicating means operative for visually indicating the modes to which the electronic system of said initial putter is switched.

55. (previously presented) A system as defined in claim 53; and further comprising indicating means operative for audio indicating the modes to which the electronic system of said initial putter is switched.

56. (currently amended) A method for manufacturing a personal golf putter, comprising providing a putting surface with at least one hole into which a golfer ~~putts~~puts balls; providing an initial putter with which the golfer hits the balls so as to put the balls into the hole and having a serial number; sensing parameters of the initial putter including the serial number during hitting the balls by the golfer to putt the balls into the hole by interior sensing means incorporated in said putter; collecting

and processing swing data corresponding to the sensed parameters by interior swing data collecting and processing means incorporated in said putter; transmitting swing data corresponding to the sensed parameters by interior transmitting means incorporated in said putter and also transmitting the serial number with each swing data; receiving and processing said swing data by computing means; receiving the swing data from said computing means, determining parameters of a personal putter based on said swing data; and making the personal putter with said parameters by design and manufacturing means obtained with use of said serial number, said interior sensing means, said interior swing data collecting and processing means and said interior transmitting means incorporated in said putter.

57. (previously presented) A method as defined in claim 56; and further comprising forming said computing means as a computer which is remote from said putting surface.

58. (previously presented) A method as defined in claim 56; and further comprising providing said data collecting and processing means with a microprocessor connected with and collecting the data from said sensing means to configure said data.

59. (previously presented) A method as defined in claim 56; and further comprising selecting said computing means from the group consisting of a remote receiving computer, a pocket personal computer with compatible signal receiving means, and a laptop computer with wireless receiving means.

60. (previously presented) A method as defined in claim 56; and further comprising providing a display unit selected from the group consisting of a display unit connected to said computing means and a display unit formed as an integral part of a said computing means.

61. (previously presented) A method as defined in claim 60; and further comprising forming said display unit so as to display any information selected from the group consisting of a position of a putter handle, position of putter head, lie and loft angles with text identifying a deviation in degrees, a putter path during a swing, and acceleration and a deceleration of a putter head alongside of a putter path, a text message with details related to a swing in real time, in combinations thereof.

62. (previously presented) A method as defined in claim 60; and further comprising providing said display with radio buttons for computer commands selected from the group consisting of save, recall, and replay.

63. (previously presented) A method as defined in claim 56, and further comprising connecting said computing means to an internet network.

64. (previously presented) A method as defined in claim 56; and further comprising providing said transmitting means so as to transmit information selected from the group consisting of lie and loft angles, a weight of putter head, a weight of a putter shaft, a location of a center of gravity of a putter head, a putter face angle, a shaft lie angle, and offset position, an identification of a golfer who hits the ball with a golf putter, the serial number of the initial putter, and combinations thereof.

65. (previously presented) A method as defined in claim 56; and further comprising providing said initial putter with a handle and a head; and providing said sensing means with acceleration/deceleration measuring means, one part of putter path measuring means, and rotation

measuring means located in said head, and also with lie/loft angles measuring and another part of the putter path measuring means located in said handle.

66. (previously presented) A method as defined in claim 56; and further comprising arranging said data collecting and processing means and said transmitting means in said handle.

67. (previously presented) A method as defined in claim 56; and further comprising providing a training putter which is identical with said final personal putter, and in addition has said sensing means, said data collecting and processing means, and said transmitting means.

68. (previously presented) A method as defined in claim 56; and further comprising providing a switch actuatable by a user and switching operation of electronic systems of said initial putter between a plurality of nodes.

69. (previously presented) A method as defined in claim 68; and further comprising providing indicating means operative for visually

indicating the modes to which the electronic system of said initial putter is switched.

70. (previously presented) A method as defined in claim 68; and further comprising providing indicating means operative for audio indicating the modes to which the electronic system of said initial putter is switched.

71. (currently amended) A putter, comprising a handle; a head; a serial number; and sensing means for sensing parameters selected from the group consisting of acceleration measuring means, deceleration measuring means, putter path measuring means, rotation measuring means, lie angle measuring means, loft angle measuring means, and combinations thereof; and means for transmitting swing data sensed by said sensing means and also transmitting the serial number with each swing data.

72. (previously presented) A putter as defined in claim 71, wherein said acceleration measuring means, said deceleration measuring means, one part of said path measuring means, and said rotation

measuring means are located in said head, while said lie angle measuring means, said loft angle measuring means, and another part of said putter path measuring means are located in said handle.

Claim 73 cancelled.

74. (previously presented) A putter as defined in claim 73, wherein said transmitting means is located in said handle.

75. (previously presented) A system for a training golf player, comprising a putter having a handle; a head; a serial number; interior sensing means incorporated in said putter and selected from the group consisting of interior acceleration measuring means, deceleration measuring means, putter path measuring means, rotation measuring means, lie angle measuring means, a loft angle measuring means, and combinations thereof; interior means for transmitting swing data measured by said measuring means and also transmitting the serial number with each swing data and incorporated in said initial putter; computing means for receiving and processing of the measured data; and display means for displaying the processed data so that a golf player can analyze his performance.

76. (previously presented) A system as defined in claim 75, wherein said putter has means for transmitting the measured data from the putter to said computing means.

77. (previously presented) A method of training a golf player, comprising the steps of providing a putter having a handle, a serial number, a head, and interior sensing means incorporated in said putter and selected from the group consisting of acceleration measuring means, deceleration measuring means, putter path measuring means, rotation measuring means, lie angle measuring means, loft angle measuring means, and combinations thereof and incorporated in said initial putter; transmitting swing data measured by interior transmitting means and also transmitting the serial number with each swing data and incorporated in said initial putter; receiving the swing data and processing the transmitted measured swing data by computing means; and displaying the processed swing data on a display so that the golf player can analyze his performance.

78. (previously presented) A method as defined in claim 77;
and further comprising transmitting the measured data from the putter by
transmitting means located in the putter.
